

Project Overview & Objectives

The dashboard consolidates KPIs, trend analysis, and category-wise insight into one interactive executive view.

The E-Commerce Executive Dashboard was developed using Tableau Public and the Sample Superstore dataset to provide a comprehensive overview of business performance. Rather than spreading metrics across disconnected reports, the dashboard brings sales, profit, order, and customer data together in a single interface that an executive can read in under a minute.

Objectives

- 01 Monitor overall business performance across sales, profit, and order volume.
- 02 Track sales growth over time to surface seasonal patterns.
- 03 Identify the most — and least — profitable regions.
- 04 Understand how each product category contributes to revenue.
- 05 Analyze customer and order metrics to gauge demand and reach.
- 06 Enable dynamic exploration through Region, Category, and Segment filters.

SCOPE NOTE

This report walks through each panel of the dashboard in turn — KPIs, the monthly trend, regional profit, category share, and customer & margin metrics — before closing with a consolidated findings summary and a full exhibit of the live interface.

Five Key Performance Indicators

Five headline metrics anchor the dashboard and give a one-glance read on overall health.

TOTAL SALES	TOTAL PROFIT	TOTAL ORDERS	CUSTOMERS	MARGIN
2,297,201	286,397	5,009	793	12.47 %

Observations

- The company generated approximately **\$2.3 million** in revenue.
- Overall profit reached **\$286K**, on more than **5,000 orders** fulfilled.
- The customer base consists of **793 unique customers**.
- The business maintains a healthy profit margin of **12.47%**.

READING THE KPI BAND

Each metric is deliberately unfiltered here — Region, Category, and Segment are all set to "All" — so this is the true company-wide baseline against which every filtered view in the live dashboard can be compared.

Monthly Sales Trend

A line chart plots `SUM(Sales)` against `Order Date → Month` to reveal the shape of demand across the year.

SALES BY MONTH — \$ THOUSANDS

Observations

- Sales fluctuate through the first eight months, with early months running relatively low.
- A sharp run-up appears in **September**, followed by a brief pullback in **October**.
- **November** records the highest sales of the year, with **December** holding close behind.

INTERPRETATION

The shaded band marks the final quarter, where sales climb well above the yearly average. The pattern is consistent with seasonal demand, festive shopping periods, promotional campaigns, and year-end purchasing behavior — the business appears to perform strongest in Q4.

Profit by Region

Regional profitability was compared across the four operating regions to identify where the business converts sales into profit most efficiently.

PROFIT BY REGION — \$

Findings

- **West** generated the highest profit of any region.
- **East** demonstrated strong profitability, well ahead of the remaining two regions.
- **South** achieved a moderate profit position.
- **Central** produced the lowest profit of the four regions.

BUSINESS RECOMMENDATION

Management should investigate the operating practices, pricing, and discounting behavior in the West region, and assess where those practices can be replicated in Central and South to lift their profit contribution.

Category Share & Sales

Sales were broken out by the three product categories to test how dependent the business is on any single line.

SHARE OF SALES

SALES BY CATEGORY - \$

Technology	36.399%
Furniture	32.300%
Office Supplies	31.301%

Insights

- **Technology** contributes the largest share of sales, just ahead of the other two categories.
- **Furniture** and **Office Supplies** maintain closely balanced shares of roughly a third each.
- With no category exceeding ~36% of revenue, business dependency on any single line is relatively diversified.

Customer Base & Profit Margin

Customer Analysis

The dashboard tracks a distinct-customer count of **793**, indicating a broad base and healthy ongoing acquisition. Future analysis could sharpen the picture by going beyond reach to look at how customers behave after their first purchase:

RETENTION

REPEAT PURCHASES

CUSTOMER LIFETIME VALUE

Profit Margin Analysis

Margin is calculated as profit divided by sales:

$$\text{Margin} = \text{Profit} \div \text{Sales} = 12.47\%$$

The business converts roughly **12 cents of profit from every dollar** of sales generated — a result that reflects reasonably efficient cost management.

100 CENTS OF \$1 IN SALES —
12.47 RETAINED AS PROFIT

Interactive Filters & Live Exhibit

Beyond the static panels covered so far, the dashboard ships with dynamic filters across **Region**, **Category**, and **Segment**, letting any stakeholder drill from the company-wide baseline into a specific slice without leaving the page.

What users can do

- Analyze regional performance in isolation, region by region.
- Compare categories side by side under any filter combination.
- Investigate customer segments to spot concentration or gaps.
- Study how the monthly sales trend shifts under different filter conditions.

WHY IT MATTERS

A static report answers the questions its author thought to ask. The filtered, interactive version of this dashboard lets an executive ask their own — turning a single PNG into a working analysis tool. The full interface is reproduced in Exhibit A, overleaf.

Live Dashboard Interface

Fig. A1 — E-Commerce Executive Dashboard, built in Tableau Public on the Sample Superstore dataset.

Key Findings & Conclusion

FINDING	OBSERVATION
Highest sales period	November
Best performing region	West
Largest category	Technology
Profit margin	12.47%
Total revenue	\$2.29M
Total profit	\$286K
Total orders	5,009
Unique customers	793

Conclusion

The Tableau Executive Dashboard successfully transforms raw transactional data into actionable business insight. The analysis reveals strong year-end sales growth, significant profitability in the West region, and a balanced category mix led by Technology products. Interactive filters extend the dashboard beyond a static report, allowing stakeholders to explore the data on their own terms.

Taken together, this positions the dashboard as an effective business-intelligence tool for monitoring organizational performance and surfacing where the next round of strategic improvement should be targeted.
